Abstract

The invention relates device to а for electrochemical detection of at least one biochemical molecule - contained in a liquid - from a group of predetermined biochemical molecules, having a means (1) for taking up the liquid, said means having at least one reference electrode (RE) and at least one counterelectrode (GE) and also a multiplicity working electrodes (AE1, AE2, AE3), at working electrode (AE1, AE2, AE3) being provided for detection of each biochemical molecule, working electrode being coated with a molecule that is complementary to the respective biochemical molecule, so that the biochemical molecules can be simultaneously,

- a potentiostat (P) for generating a predetermined voltage profile between the working electrodes (AE1, AE2, AE3) and the reference electrode (RE),
- a current/voltage converter (S1, S2, S3) being connected downstream of each of the working electrodes (AE1, AE2, AE3), the current/voltage converters (S1, S2, S3) holding all of the working electrodes (AE1, AE2, AE3) at the same potential and
- a means (Ad) for measuring the currents flowing through the working electrodes (AE1, AE2, AE3).
